13 The work in EUnetHTA 21 is a collaborative effort. Although the agencies in the Hands-on Group will be actively writing the  
14 deliverable, the entire EUnetHTA 21 consortium is involved in its production throughout various stages. This means that the  
15 Committee for Scientific Consistency and Quality (CSCQ) will review and discuss several drafts of the deliverable before  
16 validation. Afterwards, the Consortium Executive Board (CEB) will endorse the final deliverable before publication.

## 75 1 INTRODUCTION

### 76 1.1 The assessment scope

77 The basis of a Health Technology Assessment (HTA) is a set of defined research questions that are to  
78 be answered by the assessment and that together define the assessment scope. In the context of the  
79 European HTA, the assessment scope reflects policy questions from the different healthcare systems  
80 in which the HTA will be used. The PICO framework provides a standard format for specifying research  
81 questions, detailing the following parameters:

- 82 ▪ P (population)
- 83 ▪ I (intervention)
- 84 ▪ C (comparator)
- 85 ▪ O (outcomes)

86 For more details on the relevant policy questions and the PICO framework, see the PICO concept paper,  
87 which was developed in EUnetHTA Joint Action 3.<sup>1</sup>

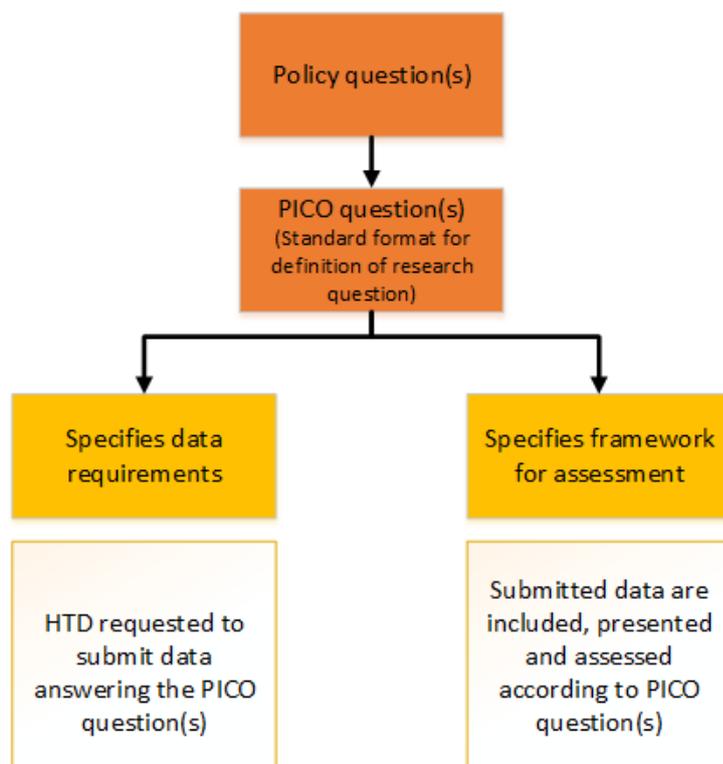

88 According to Regulation (EU) 2021/2282, the overall assessment scope for the joint clinical assessment  
89 shall be inclusive and reflect Member States' (MS) needs [Article 8 (6)]. This means that the assessment  
90 should cover the PICO(s) requested by the MS.

### 91 1.2 Role of the PICO in the assessment

92 By principle, the scope of the assessment of an intervention should not be data driven, that is, the  
93 research questions should not be deduced from the available studies. Rather, an appropriate translation  
94 of national policy questions into research questions is performed during the planning stage of the  
95 assessment. This means that a particular research question (the PICO) is prespecified for a given  
96 assessment. As such, the definition of the PICO question(s) specifies the data requirements. For an  
97 assessment that is based on a submission by a health technology developer (HTD), the PICO specifies  
98 the data requested from the HTD. Furthermore, the PICO question(s) specify the framework for the  
99 assessment (Figure 1.1).

100

101 **Figure 1-1: Role of the PICO in the assessment.**

102 HTD=health technology developer; PICO=Population, Intervention, Comparators, Outcomes.

### 103 1.3 Definition of the PICO(s) for an assessment

104 The PICO(s) for an assessment is defined during the scoping process. The scoping process is initiated  
105 by the Joint Clinical Assessment (JCA) secretariat according to the timeframe for, and well in advance  
106 of, the JCA. The aim of the scoping process is to identify the relevant PICO(s) for the assessment scope.  
107 As mentioned above, according to Regulation (EU) 2021/2282 [Article 8(6)], the assessment scope  
108 should be inclusive and reflect the MS needs.

109 To collect information about the MS needs, a PICO survey is conducted among the MS in which the MS  
110 provide information about their needs in terms of the PICO parameters (Section 3.1). Based on this input  
111 from the MS, the assessor and co-assessor develop the assessment scope. Depending on the MS  
112 needs, the assessment scope can comprise one or more PICO(s). To minimise the number of PICO(s),  
113 the assessor and co-assessor consolidate the PICO(s) as much as possible (Section 3.2).

114 The final assessment scope is provided to the HTD. It defines the data request for the assessment and  
115 enables the submission of a dossier in principle meeting the needs of every MS.

### 116 1.4 Relevant articles in Regulation (EU) 2021/2282

117 Articles from Regulation (EU) 2021/2282 directly relevant to the content of this practical guideline are:

- 118 ▪ Article 8: Initiation of joint clinical assessments;
- 119 ▪ Article 9: Joint clinical assessment reports and the dossier of the health technology developer;
- 120 ▪ Article 10: Obligations of health technology developers and consequences of noncompliance;

121 Throughout this document, any mention of articles refers to this Regulation.

## 122 2 SCOPE AND OBJECTIVE OF THE GUIDELINE

123 The objective of this practical guideline is to support the assessor and co-assessor in developing the  
124 assessment scope by describing the methods and principal steps of the scoping process. It covers the  
125 process from setting up the PICO survey to informing the HTD about the PICO(s).

126 In addition, the guideline describes the data presentation considering the definition of PICO(s).  
127 Furthermore, the impact of the statistical analysis plan of the original study versus the PICO(s) on the  
128 evidence assessment in the HTA report is addressed.

DRAFT

## 129 3 THE SCOPING PROCESS

130 In EUnetHTA 21, the scoping process starts with submission of a request for assessment by the HTD  
131 and ends when the consolidated final PICO is communicated to the HTD. Figure 3.1 lists the steps  
132 involved.

### 133 3.1 The PICO survey

#### 134 3.1.1 *Objective of the PICO survey*

135 The PICO survey provides the opportunity for each MS to identify and provide their national needs. It is  
136 the responsibility of each MS to ensure that their inputs during the PICO survey match their needs in  
137 terms of parameters and of the information, data, analysis, and other evidence to be submitted by the  
138 HTD [see requirements laid down in Article 8(6)]. MS are encouraged to involve local patients and  
139 clinical experts to ensure that their inputs cover all their needs for a national evaluation.

#### 140 3.1.2 *Available data for PICO survey*

141 The questionnaire for the PICO survey takes into account information provided by the HTD [Article 8(6)];  
142 that is, information on the intervention to be assessed and the indication for which the HTD applied in  
143 the regulatory submission dossier (in the case of medicinal products) or the intended use according to  
144 the conformity assessment [in the case of medical devices (MD)]. This information is to be provided by  
145 the HTD upon request, before the beginning of the scoping process, in a letter of intent (for EUnetHTA  
146 21 context, to the EUnetHTA secretariat) and this information will be made available to the MS.

147 The MS will be made aware of any Joint Scientific Consultation (JSC) that might have taken place for  
148 the medicinal product or MD under discussion. However, JSC recommendations might no longer be  
149 applicable because of changes in the underlying conditions (intended therapeutic indication, dynamic  
150 therapeutic landscape for comparators, etc.). The PICO for the assessment should be generated under  
151 the conditions existing at the time of the survey.

152 It should be noted that the assessor and co-assessor will not develop and propose preliminary PICOs  
153 before the PICO survey.

#### 154 3.1.3 *Format of the PICO survey*

155 The PICO survey is conducted by the JCA secretariat via an online platform accessible to all MS. MS  
156 are expected to answer within approximately 2 weeks.

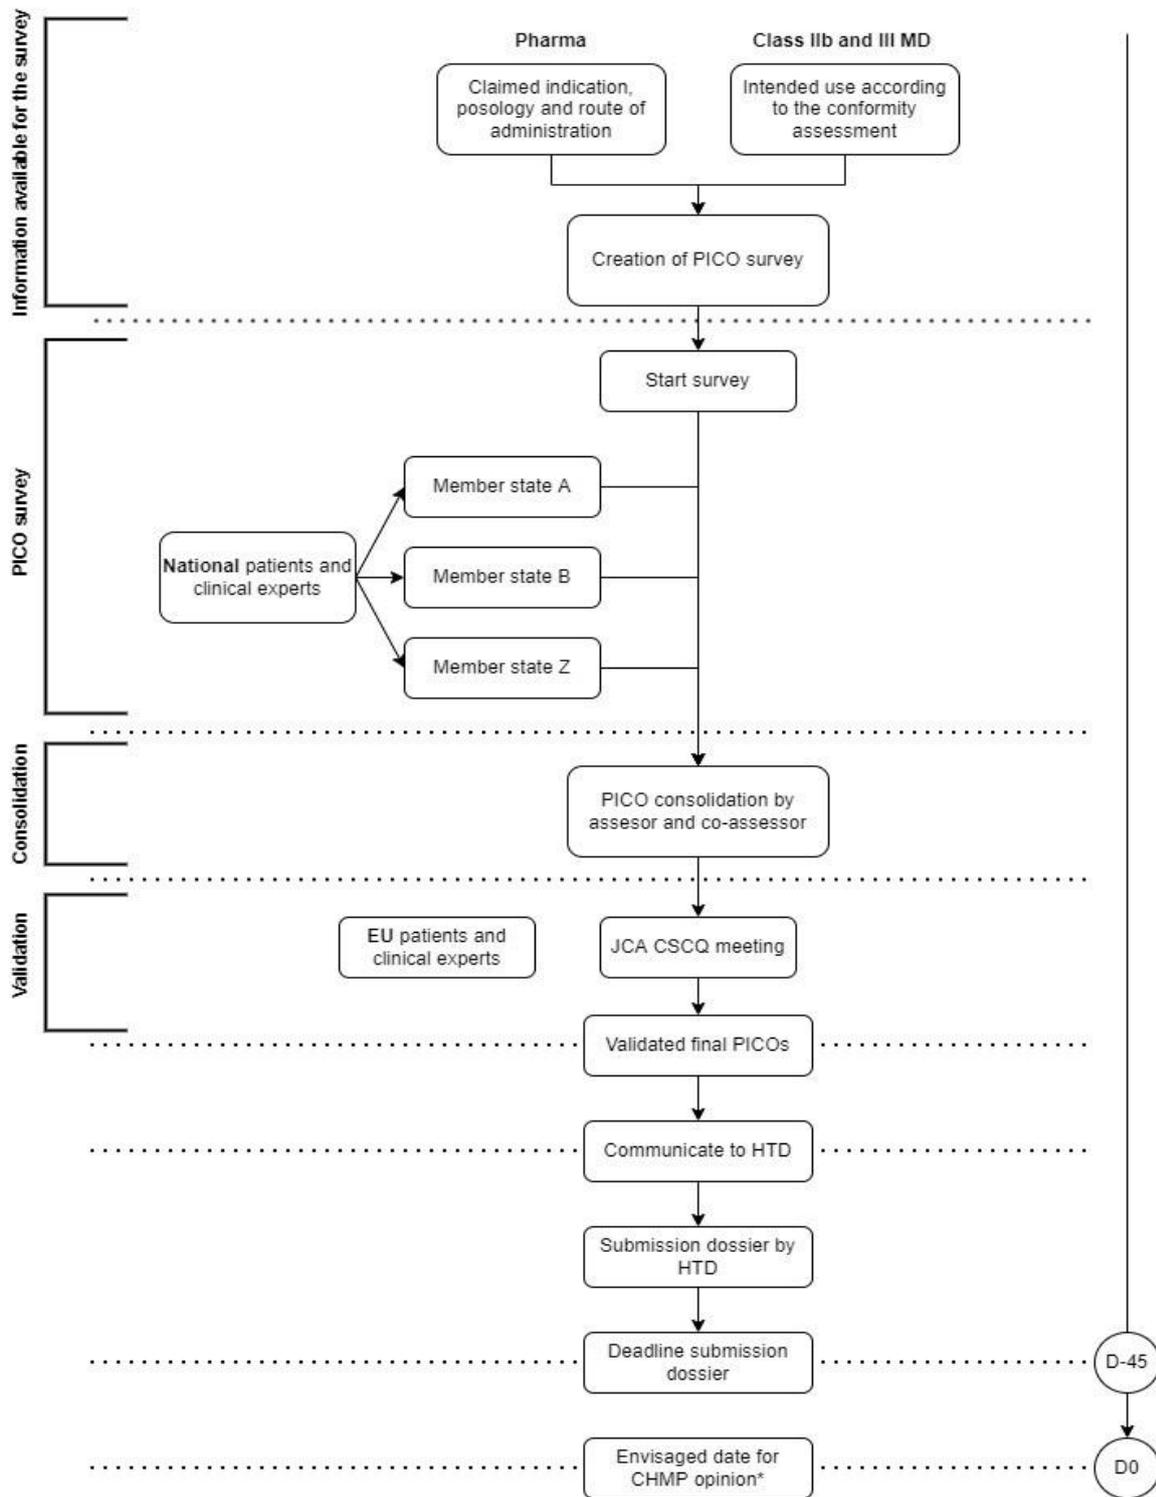

157 To meet the objective of the HTAR, which is an inclusive scope, all MS are supposed to participate in  
158 the PICO survey except those for which the specific assessment is outside of their remit. In that case,  
159 this should be indicated as an answer to the survey.

#### 160 3.1.4 *Expected inputs to the PICO survey*

161 The PICO survey asks the MS for a description of the requirements for the individual PICO parameters.  
162 It is the responsibility of the MS to define the PICO parameters according to their national legal and  
163 procedural requirements. The inputs can be found in Appendix 1.

164 Given that any specific request might broaden the scope and increase the workload of the European  
165 assessment, MS are asked to limit their requests to the extent necessary for their national decision-  
166 making.

167 Further explanation of each parameter of the PICO is given below.

\* for medicinal products (to be clarified for medical devices)

168  
169 **Figure 3-1: Steps for the scoping process**

170 CHMP=Committee for Medicinal Products for Human Use; CSCQ=Committee for Scientific Consistency and Quality;  
171 EU=European Union; HTD=health technology developer; JCA=Joint Clinical Assessment; MD=medical device; PICO=Population,  
172 Intervention, Comparators, Outcomes.

173 **Population**

174 MS should identify the relevant population(s) for the assessment scope, based on the claimed indication  
175 (in the case of medicinal products) or the intended use according to conformity assessment (in the case  
176 of MD) and their local healthcare situation. Relevant population(s) should be:

- 177
- the full patient population applied for by the HTD; and/or
  - 178 ▪ subpopulation(s): defined as part of the full population

179 The definition of the relevant population(s) should be as clear as possible and avoid ambiguity. During  
180 the PICO survey and in the JCA Committee for Scientific Consistency and Quality (CSCQ) meeting,  
181 definitions of the relevant populations should be discussed where necessary. For example, in multiple  
182 sclerosis, the term 'relapsing multiple sclerosis' has been used to describe both relapsing remitting  
183 multiple sclerosis and patients with secondary progressive multiple sclerosis with superimposed  
184 relapses.<sup>2,3</sup> Therefore, MS should state in the wording of the patient population the details of the covered  
185 patient population. The final definition is used throughout the scoping and assessment phases.

186 **Intervention**

187 The intervention should be defined according to information about the intervention to be assessed and  
188 the indication for which the HTD applied in the regulatory submission dossier (in the case of medicinal  
189 products) or the intended use according to the conformity assessment (in the case of MD).

190 Intervention for medicinal products could be: monotherapy, combination therapy, with or without best  
191 supportive care, and so on. Typically, an assessment covers one intervention (a single medicinal product  
192 or a single MD or a specific combination of therapies). In some cases, a new intervention can be added  
193 to, instead of replacing, the standard of care. In these cases, the standard of care comprises a  
194 background therapy, which could be not only a pharmacotherapy, but also a nonpharmaceutical  
195 intervention, such as psychotherapy, radiation, physiotherapy, or surgery. In rare occasions, this  
196 background therapy might differ from one MS to another. In cases in which the MS highlights a specific  
197 background therapy in the PICO survey for the intervention, the assessor and co-assessor have to  
198 decide whether to include the background therapy in the intervention part of the PICO during the  
199 consolidation phase. Variations on the intervention, such as dose or timing of administration, are  
200 potential effect modifiers and, as such, do not require a separate PICO.

201 Characteristics of the MD should be specified listing the device configurations/variants. However,  
202 different versions of the MD could impact effectiveness, and this should be considered.

203 **Comparators**

204 MS are expected to define their expectations by listing comparator(s) that are relevant for the MS HTA  
205 assessment for each of the populations they request. Comparator(s) could be approved or not (off-label)  
206 in the European Union (EU). If only one comparator out of several options is needed, comparators  
207 should be separated by 'OR'. If more than one specific comparator is needed, they should be separated  
208 by 'AND' (see example in Section 3.2).

209 A comparator can be not only a pharmacotherapy or a MD, but also other nondrug interventions, such  
210 as psychotherapy, radiation, physiotherapy, or surgery.

211 If a comparator includes a specific background therapy, the MS should clarify whether this therapy  
212 should also be part of the treatment in the group receiving the intervention. A background therapy is a

---

2 <https://www.eunetha.eu/wp-content/uploads/2020/03/PTJA08-siponimod-final-assessment-report-v2.0.pdf?x16454>

3 [https://www.ema.europa.eu/en/documents/scientific-guideline/guideline-clinical-investigation-medicinal-products-treatment-multiple-sclerosis\\_en-0.pdf](https://www.ema.europa.eu/en/documents/scientific-guideline/guideline-clinical-investigation-medicinal-products-treatment-multiple-sclerosis_en-0.pdf)

213 concurrent therapy that might be routinely taken, for example, as a standard of care for a particular  
214 condition and/or disease.

### 215 **Outcomes**

216 MS are expected to define their needs by listing several outcomes. The choice of endpoints might be  
217 informed by guidance developed in Joint Action 2 (JA2)<sup>4,5,6,7,8</sup>. Given that JCA reports should not contain  
218 any value judgement or ranking of health outcomes, the listing of outcomes for the assessment scope  
219 also should be free of any such judgement or ranking.

### 220 **Additional information**

221 MS could use this section to provide additional information for the assessor/co-assessor.

222 MS could request to explore potential effect modifiers within the population (e.g., age, sex, dose, etc.).

223 MS could specify background-associated treatment (pharmacological or not) to be added with the  
224 evaluated intervention (e.g., psychotherapy as a background therapy with an antidepressant medicinal  
225 product; a diet with an antidiabetic medicinal product; physiotherapy as a background therapy for an  
226 orthopaedic spine device, etc.) to highlight specific national care approaches. MS are expected to  
227 consider the role of background treatments carefully, because they might belong to one of the PICO  
228 elements, such as the comparator. MS should provide a clear rationale for why the background therapy  
229 is not among the PICO elements.

230 Specific requests made for additional information will be discussed on a case-by-case basis during the  
231 CSCQ JCA meeting.

### 232 **3.2 PICO consolidation**

233 After the different needs from MS have been collected through the PICO survey, the PICO consolidation  
234 phase serves to converge the variety of needs into a set of PICOs that specify the scope of the JCA and  
235 the data requirements to the HTD (for medicinal products and MDs).

236 The objective of the consolidation is to ensure that all MS needs are translated in the lowest number of  
237 PICOs possible. One PICO comprises one population, one intervention (or combination), one  
238 comparator (which can include more than one medicinal product), and at least one outcome. The steps  
239 are explained below and are illustrated with an example.

240 To achieve the fewest PICO(s) possible during the consolidation phase, the assessors/co-assessors  
241 might contact the MS to clarify open questions resulting from the PICO survey and discuss options for  
242 consolidation.

<sup>8</sup> EUnetHTA (2015): Endpoints used for Relative Effectiveness Assessment: Safety. [https://www.eunetha.eu/wp-content/uploads/2018/03/WP7-SG3-GL-safety\\_amend2015.pdf](https://www.eunetha.eu/wp-content/uploads/2018/03/WP7-SG3-GL-safety_amend2015.pdf)

243 **3.2.1 Step 1: List the requirements per MS**

244 For each MS, a table is populated with the requested population(s) per column. Each row indicates the  
245 requirements for the comparator(s). The first row concerning the comparators can be used to indicate  
246 whether the listed comparators are all required, or whether any one of those will suffice.

247 **Example (hypothetical)**

248 This example is chosen to illustrate a combination of scenarios (Tables 3.1–3.4). Therefore, the resulting  
249 number of PICO's is higher than would normally be expected.

250 **Table 3-1: PICO of Member State 1**

Member State 1	
Population(s)	Full licensed indication
	Comparator(s) Could use any of /all required
	Comparator 1
	Comparator 2

251 Explanation: this MS expressed a requirement for the assessment regarding the Full licensed indication  
252 only, and would require for this population either a comparison with Comparator 1 or a comparison with  
253 Comparator 2. This is what is called, in 'Comparators' (Subsection 3.1), an 'OR' situation.

254 **Table 3-2: PICO of Member State 2**

Member State 2			
Population(s)	Full licensed indication	Subpopulation A	Subpopulation B
	Comparator(s) Could use any of /all required	Comparator(s) Could use any of /all required	Comparator(s) <del>Could use any of /all required</del>
	Comparator 1	Comparator 1	
	Comparator 2		
	Comparator 3	Comparator 3	Comparator 3

255

256 Explanation: this MS expressed a requirement for the assessment regarding the Full licensed indication  
257 and Subpopulation A AND B. For the Full licensed indication, the MS would require a comparison with  
258 either Comparator 1 or Comparator 2 or Comparator 3. For the Subpopulation A, the MS would require  
259 a comparison with either Comparator 1 or Comparator 3. For Subpopulation B, a comparison with  
260 Comparator 3 would be required.

261

262 **Table 3-3: PICO of Member State 3**

Member State 3		
Population(s)	Subpopulation A	Subpopulation B
	Comparator(s) Could use any of /all required	Comparator(s) Could use any of /all required
	Comparator 1	
	Comparator 2	Comparator 2
		Comparator 3

263

264 Explanation: this MS expressed a requirement for the assessment regarding Subpopulation A and  
 265 Subpopulation B (and not the Full licensed indication). For the Subpopulation A, the MS would require  
 266 a comparison with either Comparator 1 or Comparator 2. For Subpopulation B, it would require a  
 267 comparison with either Comparator 2 or Comparator 3.

268 **Table 3-4: PICO of Member State 4**

Member State 4	
Population(s)	Full licensed indication
	Comparator(s) Could use any of / all required
	Comparator 3
	Comparator 4

269

270 Explanation: this MS expressed a requirement for the assessment regarding the Full licensed indication  
 271 only, and would require for this population a comparison with Comparator 3 as well as a comparison  
 272 with Comparator 4. This is what is called, in 'Comparators' (Subsection 3.1), an 'AND' situation.

273 **3.2.2 Step 2: Create tables per population and juxtapose MS requirements**

274 1) Set apart the required population(s) in separate tables and list in the columns all MS that require  
 275 this population

276 2) Add in the rows below their required comparator(s). Highlight whether the MS need either all of  
 277 those or any of those comparator(s).

278 3) The first table has, by default, the (expected) licensed indication as the population

279

280 **Example (based on Tables 3.1–3.4)**

281 **Table 3-5: List of submitted comparators for the full indication (separated by Member State)**

Full licensed indication		
Member State 1	Member State 2	Member State 4
Comparator(s) Could use any of <del>/all required</del>	Comparator(s) Could use any of <del>/all required</del>	Comparator(s) Could use any of / all required
Comparator 1	Comparator 1	
Comparator 2	Comparator 2	
	Comparator 3	Comparator 3
		Comparator 4

282

283 **Table 3-6: List of submitted comparators for Subpopulation A (separated by Member State)**

Subpopulation A	
Member State 2	Member State 3
Comparator(s) Could use any of <del>/all required</del>	Comparator(s) Could use any of <del>/all required</del>
Comparator 1	Comparator 1
	Comparator 2
Comparator 3	

284

285 **Table 3-7: List of submitted comparators for Subpopulation B (separated by Member State)**

Subpopulation B	
Member State 2	Member State 3
Comparator(s) Could use any of <del>/all required</del>	Comparator(s) Could use any of <del>/all required</del>
	Comparator 2
Comparator 3	Comparator 3

286

287 **3.2.3 Step 3: Select, per population, the required comparator(s) and assign PICO(s)**

288 The goal here is to select the lowest number of comparators needed to fulfil all MS requirements.

- 289 a) One comparator: if a MS requires one comparator for a given population, this comparator is  
290 selected. This is done for all MS. Every different comparator is assigned a separate PICO.

- 291 b) More than one required comparator and the 'AND' scenario: for every additional required  
292 comparator, a separate PICO is assigned
- 293 c) Select 'OR' comparators: if one or more MS require one comparator out of several options,  
294 check whether at least one of these comparators is included under steps a and b (below). If  
295 this is not the case, the list of comparators is crosschecked for all remaining MS for which this  
296 occurs. The lowest number of comparators needed to satisfy the requirements for all MS will  
297 determine which comparators will be selected. If no preference can be given, this will be  
298 highlighted. In this case, the comparator definition will include the alternative options. This  
299 means that the HTD can choose the most relevant comparator from the options presented.  
300 Again, a separate PICO for every additional comparator scenario (in this case with alternative  
301 options) is assigned.

302 **Example**

303 *Subpopulation B*

304 Step a: One comparator

305 Only MS 2 requires only one comparator for a particular population; it requires Comparator 3 for  
306 Subpopulation B. This results in one PICO. With the inclusion of Comparator 3, the requirements of MS  
307 3 for Subpopulation B are also satisfied. The needs of all MS with regard to Subpopulation B are fulfilled  
308 with the selection of Comparator 3. Therefore, a PICO with Comparator 2 is not necessary and will not  
309 be included.

310 *Full licensed indication*

311 Step b: More than one required comparator and the 'AND' scenario

312 MS 4 applies the AND scenario and requires two comparators (3 and 4 are both required). This results  
313 in two PICOs. MS 2 could use any of comparators 1, or, 2 or 3. Hence, with the selection of Comparator  
314 3 to fulfil the needs of MS4, the needs of MS 2 are also fulfilled. However, with the selection of  
315 comparators 3 and 4, the needs of MS 1 are not fulfilled because this MS needs Comparator 1 or 2.  
316 Therefore, an additional PICO with either of these two comparators 1 or 2 needs to be constructed. For  
317 MS 3, the Full licensed indication is not requested.

318 Given that there is no preference for either a comparison with Comparator 1 or a comparison with  
319 Comparator 2 (MS 1 and MS 2 could both use any of those two), the HTD can decide which of those  
320 two comparators will be included in the submission.

321 Therefore, in total, this population requires three PICOs: two PICOs that cover the needs for MS 4  
322 (comparators 3 and 4) and one PICO that covers the needs of MS 1. The needs for MS 2 are included  
323 in those PICOs.

324 *Subpopulation A*

325 Step c: Select 'OR' comparators

326 With Comparator 1, the requirements of both MS 2 and 3 are satisfied. This requires one PICO. Inclusion  
327 of Comparator 2 or Comparator 3 to fulfil the requirements of MS 2 and MS 3 would lead to a superfluous  
328 PICO and, therefore, neither comparator is not chosen.

329 **3.2.4 Step 4: Populate a PICO table with the results of step 3**

- 330 1) Each PICO is placed in a separate column. The required comparators are placed in the row  
331 below.

332 2) The required outcomes are added in the row below the comparators. For this, the guidelines on  
333 the selection of outcomes should be followed.<sup>9,10,11,12,13</sup> In principle, all outcomes should be  
334 included for all PICOs.

335 Figure 3.2 summarises the four steps of the PICO consolidation process. Applying these four steps  
336 should result in the smallest possible number of PICOs that meet the needs of all MS (called the MIN-  
337 MAX principle in the PICO concept paper). After applying these four steps, whether the needs of all MS  
338 are indeed met should be checked. In the example, crosschecking the PICO table below (Table 3.8)  
339 with the hypothetical PICO survey results as populated in step 1 shows that this is indeed the case. The  
340 PICO table is the end product of the PICO consolidation and can be used for further reference in the  
341 scoping and assessment process.

348

349 **3.3 PICO validation: CSCQ JCA meeting**

350 PICOs resulting from the PICO survey as consolidated by the assessor and co-assessor are presented  
351 to the CSCQ JCA meeting. This presentation could take place during a programmed JCA CSCQ  
352 meeting or during a dedicated meeting, if timelines dictate. During this meeting, the assessor and co-  
353 assessor present the PICOs, including results of the survey, consolidation tables, and the proposal for  
354 consolidated PICOs. CSCQ members as well as patients and clinical experts are invited to comment on  
355 the consolidated PICOs. However, a consensus should be reached that respects all MS requirements  
356 because this requirement is determined by Article 8(6). CSCQ members should validate the final PICOs.  
357 The validated PICOs will be forwarded to the HTD.

358 **3.4 Risk of labelling/CE marking indication(s) change**

359 Given the timelines of the JCA, the scoping process has to be completed before Committee for Medicinal  
360 Products for Human Use (CHMP) opinion/Conformité Européenne (CE) marking indication(s). This  
361 means that the anticipated population might change after the PICOs have been postulated because of  
362 the regulatory process.

363 If CHMP opinion/CE marking recommends a different indication from the one initially applied for, an  
364 update of the PICOs is expected and the evaluation process will be delayed. A solution is needed to  
365 account for the risk of labelling change.

366 In the future HTAR, cooperation between the assessor/co-assessor and the corresponding regulatory  
367 team, according to Article 15(1), is planned and it should be explored whether this could contribute to a  
368 solution. In EUnetHTA 21, similar cooperation, although encouraged, could be more difficult to achieve  
369 because of the lack of a legal framework with the European Medicines Agency (EMA) and the Medical  
370 Device Coordination Group (MDCG).

<sup>14</sup> The HTD can decide which of those two will be included in the submission.

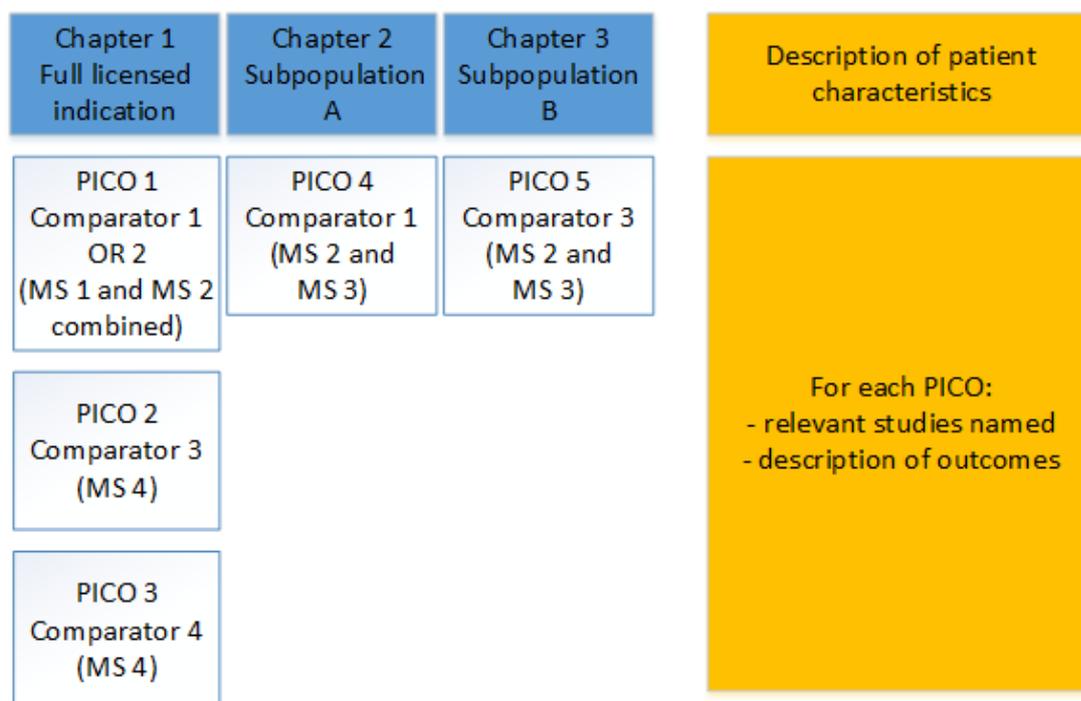

371 **4 INFORMATION FOR THE HTD**

372 Once PICO consolidation is completed and the scope of the assessment is validated by the CSCQ, the  
373 HTD is informed of the scope and the PICO(s) included. This scope defines the data request for the  
374 assessment. The HTA submission dossier should cover this data request.

DRAFT

## 375 5 DATA PRESENTATION IN THE HTA REPORT CONSIDERING THE PICO(S)

376 The PICO consolidation as explained in Subsection 3.2 has consequences for data presentation in the  
377 JCA. From the above, it follows that more than one PICO per population can be created in cases where  
378 there is more than one comparator brought forward by MS. For the JCA, all PICOs relevant for a single  
379 population can be clustered into one chapter in the report. Each relevant comparator is then assessed  
380 sequentially. Thus, the JCA comprises different chapters of assessments structured by population. In  
381 case of the situation as illustrated in Example 1 (above), this would result in three chapters: Chapter 1,  
382 Full licensed indication; Chapter 2, Subpopulation A; and Chapter 3, Subpopulation B, as illustrated by  
383 the example in Figure 5.1.

384 **Figure 5-1: Data presentation according to PICO(s).**

385 MS, Member State; PICO=Population, Intervention, Comparators, Outcomes.

387  
388 Each population or subpopulation then constitutes a chapter in the report, and each comparator requires  
389 a subsection thereof. Each chapter will start with a description of the population it covers and each  
390 subsection with the comparator it covers. For the example as presented in chapter 3 of this guideline,  
391 the report will constitute the following three assessment chapters: Full licensed indication;  
392 Subpopulation A; and Subpopulation B. Note that only the first chapter has three subsections because  
393 it encloses three different comparators (Comparator 3, Comparator 4, and Comparator 1 OR 2). In  
394 Chapter 3 of the example, Comparator 3 is used once again; thus, the description of this comparator  
395 can be copied from, or a reference can be made to, the first chapter.

396 Further consequences are that a situation might arise in which different PICOs use the same studies as  
397 a basis. To prevent duplication throughout the JCA, description of (elements of) studies that would  
398 otherwise be repeated again in each chapter will be described at the beginning of the result section,  
399 which should also include results of information retrieval and characteristics of the included studies  
400 (Annexe I, HTAR). In addition, the intervention is a common element to each of the assessment  
401 chapters; thus, again to prevent duplication across chapters, a chapter occurring before the assessment  
402 chapters can describe (common elements of) the intervention. Further detailing of the report structure  
403 and data presentation will form part of the EUnetHTA 21 template.

404 **6 IMPACT OF THE STATISTICAL ANALYSIS PLAN OF THE ORIGINAL STUDY**  
405 **VERSUS THE PICO(S) ON THE EVIDENCE ASSESSMENT IN THE HTA**  
406 **REPORT**

407 As described above, the PICOs are developed based on the national policy questions to be answered  
408 by the assessment. As such, they are not driven by the available studies. Nevertheless, in many cases,  
409 the studies available for the assessment might cover a specific PICO. However, there might also be  
410 cases in which the available studies do not reflect a given PICO. For example, the specific PICO might  
411 comprise only a subpopulation of the population included in a study available for the assessment.

412 To meet the data requirements for an assessment according to a specific PICO, the available studies  
413 might need to be reanalysed to provide a data set suitable for the assessment. This analysis will deviate  
414 from the original study planning but is required for the HTA by the definition of the PICO. This deviation  
415 should be clearly mentioned. The r-analyses will be provided by the HTD in the submission dossier.

416 In the assessment report, it should be clear which data sets are from an analysis according to the original  
417 study planning and which are based on reanalyses resulting from PICO requests. In any case, the  
418 original study analyses will be included in the dossier.

## 421 8 CONSIDERATIONS FOR THE HTA REGULATION

422 The HTAR serves as the basis for this deliverable. Given the general framework of EUnetHTA 21, this  
423 guideline deviates in some steps from the processes defined in the HTAR, in particular:

- 424 ▪ The cooperation between assessor/co-assessor and the corresponding regulatory team,  
425 according to Article 15(1) of the HTAR could not be explored during EUnetHTA 21.
- 426 ▪ Some steps of the processes in the HTAR (Articles 7 and 10) could not be introduced, such as the  
427 coordination group, corresponding subgroups, or the role of the European Commission will only  
428 be defined later under the HTAR. This could affect, for example, the starting point of a PICO  
429 survey for MD.
- 430 ▪ Much of the content of this document is applicable to both EUnetHTA 21 and the HTAR. Where  
431 relevant, the differences will be specified. However, the scope of this guideline is limited to the  
432 relevant functions in EUnetHTA 21 only, given that the task of the corresponding committees  
433 might differ.

434 Input from patient organisations or clinical experts should be considered in the future in relation to  
435 implementing the HTAR.

436

DRAFT

## Appendix A PICO SURVEY FORM

This is the PICO survey form for (intervention) in an (intended indication). This PICO survey provides the opportunity for each MS to identify and provide their national needs. Input provided during the PICO survey will be considered as the official standpoint of responding MS. Each MS has the full responsibility for its internal process (including the involvement of patients and clinical experts) to achieve this official standpoint. MS are expected to answer within 2 weeks.

### Medicinal products JCA/high-risk medical device JCA PICO form

MS need to fill in each PICO parameter for each PICO(s) (in the case of multiple PICO(s)).

Parameter	PICO 1	Other PICO(s) (if needed)
<b>Population</b>	Relevant population for the assessment scope [see 'Population' (Subsection 3.1)]	<p><i>In case of multiple PICO(s), separate columns should be made for the different aspects.</i></p> <p><i>If PICO(s) are similar with regard to some parameters (e.g., no differences between the PICO(s) on outcomes), the cells should be merged between adjacent identical columns.</i></p>
<b>Intervention</b>	Intervention to be assessed [see 'Intervention' (Subsection 3.1)]	
<b>Comparator(s)</b>	Expected comparators. In the case of several comparators, 'OR' or 'AND' separation must be chosen [see 'Comparators' (Subsection 3.1)]	
<b>Outcomes</b>	Expected outcome (effectiveness, safety, quality of life) [see 'Outcomes' (Subsection 3.1)]	
<b>Additional information</b>	See 'Additional information' (Subsection 3.1)
